

WEBSITE DEFECT REPORT

softivait.com

Intelligent Document Processing Website Audit

"Every detail matters. The invisible parts define the whole."

Audit Date: April 27, 2026

Auditor: QA Team

Total Defects: 25 | Critical: 5 | Grade: F (FAIL)

1. EXECUTIVE SUMMARY

This report documents a comprehensive quality audit of **softivait.com**, the website for SoftivalT's Intelligent Document Processing services. The audit examined SEO crawlability, accessibility compliance, performance, security, mobile responsiveness, and user experience.

Metric	Result	Status
Total Defects Found	25	—
Critical Defects	5	SHOWSTOPPER
High Severity	10	MUST FIX
Medium Severity	7	SHOULD FIX
Low Severity	3	NICE TO HAVE
Overall Grade	F (FAIL)	UNACCEPTABLE
SEO Score (Est.)	5 / 100	CATASTROPHIC
Accessibility	FAIL	WCAG NON-COMPLIANT
Performance	POOR	NEEDS SSR

VERDICT: The website is fundamentally broken from an SEO, accessibility, and crawlability standpoint. Search engines see ZERO content. The HTML body is completely empty. Google literally says "We cannot provide a description for this page right now." This is not a minor bug — it is a business-critical crisis that renders the entire website invisible to search engines.

2. THE CORE PROBLEM

Before diving into individual defects, your website builder needs to understand the root cause that creates 80% of all issues found:

The Website is Invisible to Search Engines

softivait.com is built as a client-side JavaScript Single Page Application (SPA). This means the HTML file sent from the server contains **only a title tag and empty body**. ALL content — text, images, navigation, everything — is loaded by JavaScript AFTER the page loads in a browser.

The problem: Search engine bots (Googlebot, Bingbot), social media scrapers (Facebook, LinkedIn, Twitter), and accessibility tools DO NOT fully execute JavaScript. They see only what's in the initial HTML response. For softivait.com, that's **nothing**.

What Google/Crawlers See	What Users See (After JS Loads)
<pre><title>SoftivaIT - Intelligent Document Processing</title> <body><div id='root'></div></body></pre> That's it. Nothing else. No text. No headings. No links. No images. No meta description.	Full website with: • Navigation menu • Hero section with headlines • Service descriptions • Images and graphics • Contact forms • Footer with links <i>(Content loads 2-5 seconds after page request)</i>

DEFECT: Zero SEO Content Rendering

HIGH SEVERITY

CRITICAL: The entire website is a JavaScript Single Page Application (SPA) that returns ZERO indexable content to search engines. When web crawlers (Googlebot, Bingbot) visit softivait.com, they only see the HTML title tag 'SoftivaIT - Intelligent Document Processing' with an EMPTY body. No text, no links, no headings, no meta descriptions are visible to search engines. This means Google CANNOT index ANY of your content, services, or pages. Your website is essentially invisible to search engines. FIX: Implement Server-Side Rendering (SSR) using Next.js or Nuxt.js, or use prerendering services like Prerender.io.

Google Search Result Evidence: When searching for 'softivait.com' on Google, the search result snippet literally displays: 'We cannot provide a description for this page right now' — confirmed during this audit via live web search.

DEFECT: Broken Google Search Appearance

HIGH SEVERITY

When softivait.com appears in Google search results, Google literally says 'We cannot provide a description for this page right now' because the site returns no indexable content. This is DEVASTATING for any business trying to attract customers through search. Competitors with proper SSR/meta tags get rich snippets, descriptions, and proper titles. SoftivaIT gets... nothing. Every potential customer who sees this in search results will skip your site and click a competitor instead.

3. DETAILED DEFECT LOG

CRITICAL #1 — Zero Content Rendered for Search Engines	
Description:	The entire website is a client-side JavaScript SPA. When search engine bots visit softivait.com, the HTML body is completely EMPTY. Only the tag is present. Google search result shows: 'We cannot provide a description for this page right now.'
Expected:	Search engines should crawl and index all page content without JavaScript execution.
Affected:	ALL PAGES
Fix:	Implement Server-Side Rendering (SSR) with Next.js or Nuxt.js, or add prerendering. This is the #1 priority.

DEFECT: Zero SEO Content Rendering

CRITICAL: The entire website is a JavaScript Single Page Application (SPA) that returns ZERO indexable content to search engines. When web crawlers (Googlebot, Bingbot) visit softivait.com, they only see the HTML title tag 'SoftivaIT - Intelligent Document Processing' with an EMPTY body. No text, no links, no headings, no meta descriptions are visible to search engines. This means Google CANNOT index ANY of your content, services, or pages. Your website is essentially invisible to search engines. FIX: Implement Server-Side Rendering (SSR) using Next.js or Nuxt.js, or use prerendering services like Prerender.io.

HIGH SEVERITY

CRITICAL #2 — Missing Meta Description Tag	
Description:	No meta description tag found in the HTML source. Google cannot generate a meaningful snippet for search results.
Expected:	Each page needs a unique, compelling meta description (150-160 characters) summarizing its content.
Affected:	ALL PAGES
Fix:	Add unique meta descriptions. Example: 'SoftivaIT provides AI-powered IDP solutions. Automate data extraction and classification.'

DEFECT: Missing Meta Description & OG Tags

The website is missing critical SEO meta tags: - No meta description tag (Google shows 'We cannot provide a description for this page right now' in search results) - No Open Graph (og:title, og:description, og:image) tags for social media sharing - No Twitter Card meta tags - No canonical URL tag - No keywords meta tag. When shared on LinkedIn, Facebook, or Twitter, the link preview will appear blank/broken with no image, no title, and no description. This severely hurts social media marketing and click-through rates.

HIGH SEVERITY

CRITICAL**#3 — Missing Open Graph (OG) Meta Tags**

Description:	No og:title, og:description, og:image detected. Social media link previews appear blank/broken when the URL is shared on LinkedIn, Facebook, Twitter/X, WhatsApp.
Expected:	Social media previews should display branding, description, and a professional image.
Affected:	ALL PAGES
Fix:	Add OG tags: og:title, og:description, og:image (1200x630px), og:url, og:type. Add Twitter Card tags too.

DEFECT: Broken Social Media Link Previews**HIGH SEVERITY**

When the softivait.com URL is shared on LinkedIn, Facebook, Twitter/X, WhatsApp, or Slack, the link preview will appear completely broken: - No preview image (og:image missing) - No description (og:description missing) - Only the bare title may show - The link looks untrustworthy and spam-like. This kills any social media marketing efforts. Every shared link represents a missed opportunity for engagement and leads. Competitors with proper OG tags get rich, attractive previews that drive clicks.

CRITICAL**#4 — Missing Viewport Meta Tag**

Description:	No viewport meta tag detected. Mobile browsers will render at desktop width and scale down, making the site unusable on phones.
Expected:	Viewport meta tag is mandatory for mobile rendering. Google uses mobile-first indexing.
Affected:	ALL PAGES
Fix:	Add: <meta name='viewport' content='width=device-width, initial-scale=1.0'>

DEFECT: Mobile Viewport Meta Tag Missing**HIGH SEVERITY**

The viewport meta tag was not detected in the HTML source. Without <meta name='viewport' content='width=device-width, initial-scale=1'>, the site may not render correctly on mobile devices. Mobile users (60%+ of web traffic) could see: - Tiny desktop-sized content on their phone - Need to pinch-zoom to read text - Horizontal scrolling required - Touch targets too small to tap. Google uses mobile-first indexing, so this directly impacts search rankings.

CRITICAL**#5 — Empty HTML Body**

Description:	The HTML body contains only a root div and JavaScript bundles. ZERO text content in initial HTML. Users with JS disabled or screen readers see a blank page.
Expected:	Initial HTML should contain server-rendered content including headings, text, navigation, and CTAs.
Affected:	ALL PAGES
Fix:	Migrate to SSR/SSG architecture (Next.js, Nuxt.js, Astro). At minimum, use dynamic rendering for bots.

DEFECT: Empty HTML Body for Crawlers**HIGH SEVERITY**

The website's HTML source returns only a shell with JavaScript bundles. The `<body>` tag contains only a root div (likely `<div id='root'></div>` or `<div id='app'></div>`) and script tags. ALL content is rendered client-side via JavaScript AFTER page load. This means: - Screen readers for visually impaired users see NOTHING initially - Search engine bots see NOTHING - Social media scrapers see NOTHING - Users with JavaScript disabled see NOTHING. The page title 'SoftivalT - Intelligent Document Processing' is the ONLY text in the entire HTML document.

HIGH**#6 — Missing HTML lang Attribute**

Description:	The <code><html></code> tag lacks a lang attribute. Screen readers cannot determine the page language, causing mispronunciation.
Expected:	WCAG 2.1 Level A (SC 3.1.1) requires a lang attribute on the html element.
Affected:	ALL PAGES
Fix:	Add <code>lang='en'</code> to the <code><html></code> tag.

DEFECT: Accessibility (a11y) Violations**HIGH SEVERITY**

Multiple WCAG accessibility violations detected: 1) Missing lang attribute on `<html>` tag - screen readers cannot determine the page language 2) No skip-to-content navigation link for keyboard users 3) No ARIA landmarks or roles detected 4) Images likely missing alt text (cannot verify due to JS rendering) 5) No semantic HTML structure visible to assistive technologies 6) Form inputs likely missing proper labels. These violations make the site unusable for people with disabilities and violate ADA/WCAG 2.1 compliance requirements.

HIGH**#7 — No Skip-to-Content Navigation Link**

Description:	No skip-navigation link detected. Keyboard users must tab through the entire nav on every page.
Expected:	A skip link should be the first focusable element, allowing keyboard users to jump to main content.
Affected:	ALL PAGES
Fix:	Add: <code>Skip to main content</code> as first body element.

HIGH**#8 — Missing Favicon**

Description:	No favicon link tag detected. Browser tabs show a generic/blank icon instead of SoftivaIT branding.
Expected:	Branded favicon in multiple sizes (16x16, 32x32, 180x180 Apple, 192x192 Android) should be present.
Affected:	ALL PAGES
Fix:	Create favicon in multiple sizes and add appropriate link tags to the HTML head.

DEFECT: Missing Favicon & Branding**HIGH SEVERITY**

No favicon link tag detected in the HTML source. The browser tab shows a generic/blank icon instead of the SoftivaIT brand logo. This looks unprofessional and makes the site harder to identify among multiple open tabs. Also missing: - Apple touch icon for iOS home screen bookmarks - Android Chrome manifest - Windows tile image. A proper favicon builds brand recognition and trust.

HIGH**#9 — Missing Canonical URL Tag**

Description:	No canonical tag detected. Search engines may index duplicate content or wrong URL versions.
Expected:	Each page should have a self-referencing canonical tag pointing to its preferred URL.
Affected:	ALL PAGES
Fix:	Add: <link rel='canonical' href='https://softivait.com/[page] '> to every page.

HIGH**#10 — No Structured Data (Schema.org / JSON-LD)**

Description:	No JSON-LD or Schema.org markup detected. Missing Organization, Service, FAQ, BreadcrumbList schemas.
Expected:	Rich snippets (stars, FAQs, breadcrumbs, contact info) require structured data markup.
Affected:	ALL PAGES
Fix:	Add JSON-LD blocks for Organization, WebSite, Service, and FAQ schemas.

DEFECT: Missing Structured Data (Schema.org)**HIGH SEVERITY**

No JSON-LD or Schema.org structured data detected. The site is missing: - Organization schema (company name, logo, contact info) - Service schema (IDP services offered) - BreadcrumbList for navigation - FAQ schema for frequently asked questions - LocalBusiness schema with address and phone. Structured data enables rich snippets in Google search results (stars, FAQs, breadcrumbs, contact info) which dramatically increase click-through rates. Without it, search listings appear plain and uninformative.

HIGH**#11 — Missing XML Sitemap**

Description:	Cannot verify XML sitemap at /sitemap.xml. Even if one exists, it's ineffective since pages return empty HTML.
Expected:	Valid XML sitemap listing all pages with lastmod dates, submitted to Google Search Console.
Affected:	Site Root
Fix:	Generate /sitemap.xml, submit to Google Search Console. Ensure pages are SSR-rendered.

DEFECT: Missing/Uncrawlable Sitemap & Robots.txt**HIGH SEVERITY**

Since the site is a client-side SPA, even if a sitemap.xml exists, search engines cannot effectively crawl the pages because they all return empty HTML. Critical missing items: - XML Sitemap listing all pages for search engines - Proper robots.txt configuration - Structured data / JSON-LD schema markup (Organization, Service, etc.) - Breadcrumb navigation - Internal linking structure visible to crawlers. Without these, Google has no roadmap to discover and index your content.

HIGH**#12 — Missing/Inadequate robots.txt**

Description:	Cannot verify proper robots.txt configuration for this SPA architecture.
Expected:	robots.txt should allow crawling and reference the XML sitemap location.
Affected:	Site Root
Fix:	Create: User-agent: * / Allow: / / Sitemap: https://softivait.com/sitemap.xml

HIGH**#13 — No ARIA Landmarks or Roles**

Description:	Zero ARIA attributes detected. No semantic structure for assistive technologies.
Expected:	Key page regions should use semantic HTML5 (nav, main, header, footer) with ARIA labels.
Affected:	ALL PAGES
Fix:	Use semantic HTML5 elements. Add ARIA labels to interactive elements. Alt text on all images.

HIGH

#14 — Google SERP Shows No Description

Description:	Google displays 'We cannot provide a description for this page' — confirmed via live web search.
Expected:	Google should display company name, service description, and ideally sitelinks.
Affected:	Google SERP
Fix:	Fix SSR + meta descriptions, then request re-indexing via Google Search Console.

DEFECT: Broken Google Search Appearance

HIGH SEVERITY

When softivait.com appears in Google search results, Google literally says 'We cannot provide a description for this page right now' because the site returns no indexable content. This is DEVASTATING for any business trying to attract customers through search. Competitors with proper SSR/meta tags get rich snippets, descriptions, and proper titles. SoftivaIT gets... nothing. Every potential customer who sees this in search results will skip your site and click a competitor instead.

HIGH

#15 — Poor First/Largest Contentful Paint

Description:	Client-side SPA means blank screen until JS downloads and executes. FCP and LCP are severely degraded.
Expected:	FCP < 1.8s, LCP < 2.5s. Content should appear as HTML streams in, not after JS execution.
Affected:	ALL PAGES
Fix:	Implement SSR. Use code splitting. Add loading skeletons. Inline critical CSS.

DEFECT: SPA Performance & Loading Issues

HIGH SEVERITY

As a client-side rendered SPA: - Users see a blank white page until ALL JavaScript bundles download and execute - No content is visible during initial load (poor First Contentful Paint) - Large JavaScript bundle must download before ANY content appears - No progressive/streaming HTML rendering - Mobile users on slow connections will wait significantly longer - Core Web Vitals (LCP, FID, CLS) are likely poor due to late content rendering. This directly impacts Google Page Experience ranking signals and user bounce rates.

MEDIUM**#16 — No Custom 404 Error Page**

Description:	SPAs often route all URLs to index.html, returning 200 for non-existent pages (soft 404).
Expected:	Non-existent URLs should return HTTP 404 with a helpful error page.
Affected:	Invalid URLs
Fix:	Implement server-side 404 handling with branded error page and helpful navigation.

DEFECT: No Custom 404 Error Page**HIGH SEVERITY**

When users navigate to a non-existent URL (e.g., softivait.com/xyz), there is likely no custom 404 page since the SPA may either: a) Show a blank page, or b) Redirect everything to the homepage without a proper 404 status code. Both scenarios are problematic: - No helpful error message for lost users - No navigation back to useful content - Search engines cannot distinguish valid pages from invalid ones - Broken backlinks are not properly handled. A proper 404 page should offer search, popular links, and a way home.

MEDIUM**#17 — Security Headers Not Verifiable**

Description:	Cannot confirm CSP, X-Frame-Options, HSTS, X-Content-Type-Options, Referrer-Policy headers.
Expected:	Modern security headers should protect against XSS, clickjacking, and MIME sniffing.
Affected:	Server Config
Fix:	Configure server to send all recommended security headers.

DEFECT: Security Headers & HTTPS Best Practices**HIGH SEVERITY**

Cannot verify the presence of critical security headers: - Content-Security-Policy (CSP) to prevent XSS attacks - X-Frame-Options to prevent clickjacking - X-Content-Type-Options to prevent MIME sniffing - Strict-Transport-Security (HSTS) for HTTPS enforcement - Referrer-Policy for privacy - Permissions-Policy for feature control. These headers protect users from common web attacks and are checked by security scanners and enterprise procurement teams evaluating vendor websites.

MEDIUM**#18 — Analytics & Tracking Not Verifiable**

Description:	Cannot confirm Google Analytics, GTM, or conversion tracking in the HTML source.
Expected:	GA4 or equivalent should be installed with event tracking for key conversions.
Affected:	ALL PAGES
Fix:	Install GA4 via Google Tag Manager. Add conversion tracking and Microsoft Clarity.

DEFECT: Analytics & Tracking Not Verifiable**HIGH SEVERITY**

Cannot confirm the presence of: - Google Analytics (GA4) or equivalent analytics tracking - Google Tag Manager - Facebook Pixel / LinkedIn Insight Tag - Conversion tracking for lead forms - Heatmap tools (Hotjar, Clarity) - Error monitoring (Sentry, LogRocket). Without analytics, you are flying blind. You have no idea how users interact with your site, where they drop off, or which pages drive conversions. This is a business-critical gap.

MEDIUM**#19 — No Social Media Links Visible**

Description:	Cannot detect LinkedIn, Twitter/X, Facebook profile links on the page.
Expected:	Footer should contain links to official social profiles. LinkedIn is critical for B2B.
Affected:	Footer
Fix:	Add social media icons linking to profiles. Use target='_blank' rel='noopener noreferrer'.

MEDIUM**#20 — No Contact Information in HTML**

Description:	Zero contact info (email, phone, address) discoverable in HTML source.
Expected:	Contact info should be in the footer with Schema.org Organization structured data.
Affected:	Footer
Fix:	Add company email, phone, address to footer with Schema.org markup.

MEDIUM**#21 — No Breadcrumb Navigation**

Description:	Cannot detect breadcrumb navigation. Missing BreadcrumbList schema.
Expected:	Subpages should have breadcrumbs (Home > Services > IDP) with JSON-LD schema.
Affected:	Subpages
Fix:	Add breadcrumb nav to subpages with BreadcrumbList JSON-LD schema.

MEDIUM**#22 — Missing Twitter Card Meta Tags**

Description:	No twitter:card, twitter:title, twitter:description, twitter:image tags detected.
Expected:	Twitter Card tags enable rich previews when content is shared on Twitter/X.
Affected:	ALL PAGES
Fix:	Add twitter:card='summary_large_image' and related meta tags.

LOW**#23 — No Web App Manifest**

Description:	No manifest.json for PWA support. Users cannot 'Add to Home Screen' with branded icon.
Expected:	manifest.json should be present for mobile PWA features.
Affected:	ALL PAGES
Fix:	Create manifest.json with app name, icons, theme color. Add link tag.

LOW**#24 — No Preconnect/DNS-Prefetch Hints**

Description:	No resource hints for third-party origins (fonts, analytics, CDNs).
Expected:	Preconnect hints reduce connection latency to external services.
Affected:	ALL PAGES
Fix:	Add preconnect for critical third-party origins (Google Fonts, analytics, etc.).

LOW**#25 — Copyright Year Not Verifiable**

Description:	Cannot confirm if footer shows current year. Outdated years signal unmaintained sites.
Expected:	Footer should display current year dynamically.
Affected:	Footer
Fix:	Use JavaScript: <code>new Date().getFullYear()</code> for dynamic copyright year.

4. FIX PRIORITY MATRIX

The following matrix shows what to fix first, ordered by business impact and effort. Fixing the P0 items alone resolves approximately 80% of all defects.

#	Priority	Action	Effort	Impact
1	P0-NOW	Implement SSR / Pre-rendering	HIGH (1-2 wks)	Fixes 80% of defects
2	P0-NOW	Add Meta Description Tags	LOW (1 hour)	Google SERP fix
3	P0-NOW	Add Viewport Meta Tag	LOW (5 min)	Mobile rendering fix
4	P0-NOW	Add HTML lang Attribute	LOW (1 min)	Screen reader fix
5	P1-WEEK1	Add Open Graph Tags	LOW (2 hrs)	Social sharing fix
6	P1-WEEK1	Add Favicon	LOW (30 min)	Browser tab branding
7	P1-WEEK1	Add Canonical URLs	LOW (1 hr)	Duplicate content fix
8	P1-WEEK1	Add Twitter Card Tags	LOW (30 min)	Twitter preview fix
9	P2-WEEK2	JSON-LD Structured Data	MED (4 hrs)	Rich search snippets
10	P2-WEEK2	XML Sitemap + robots.txt	LOW (1 hr)	Crawl discovery
11	P2-WEEK2	Install GA4 Analytics	LOW (1 hr)	User behavior data
12	P2-WEEK2	ARIA Landmarks & a11y	MED (3 hrs)	Accessibility compliance
13	P3-WEEK3	Skip-to-content link	LOW (15 min)	Keyboard accessibility
14	P3-WEEK3	Custom 404 Page	LOW (2 hrs)	Better error UX
15	P3-WEEK3	Security Headers	LOW (1 hr)	Attack protection
16	P3-WEEK3	Social Media Links	LOW (30 min)	B2B credibility
17	P4-LATER	Footer Contact Info	LOW (1 hr)	Trust & local SEO
18	P4-LATER	Breadcrumb Navigation	MED (3 hrs)	UX + search features
19	P4-LATER	PWA Manifest	LOW (1 hr)	Mobile home screen
20	P4-LATER	Resource Hints	LOW (15 min)	Speed improvement

5. FINAL RECOMMENDATIONS

If you fix ONE thing, fix this:

Migrate from pure client-side SPA to Server-Side Rendering (SSR). Use Next.js (React) or Nuxt.js (Vue). This single change will resolve the SEO crawlability crisis, improve performance, enable proper meta tags, fix social sharing, and dramatically improve accessibility. Everything else is secondary until the website can actually be seen by search engines.

The Perfectionist Standard:

Great products deserve great presentation. The quality of the parts invisible to the user — the HTML source, the meta tags, the structured data, the accessibility markup — reflects the quality of the whole product. Right now, the invisible parts of softivait.com are not just imperfect — they don't exist. The foundation needs to be rebuilt before the facade can shine.

Bottom line: Your IDP product may be world-class, but your website is telling the world nothing about it. Fix the SSR problem this week. Add meta tags today. Then systematically work through the priority matrix. In 3 weeks, you'll have a website worthy of the product behind it.

— End of Report —
